**Claim Amendments:**

Cancel claims 15, 20, and 21, and rewrite claims 14, 16, 22, 23, and 24, as follows:

1-13 (cancelled).

14. (currently amended) A device for cleaning floors and similar surfaces, comprising a stick, which is connected, at a terminal portion thereof, by way of kinematic connection means, to a supporting means, which is associable with cleaning means, wherein said supporting device means comprises at least two arms, which lie along respective main longitudinal directions and are mounted so that they can rotate with respect to said stick about a respective articulation axis in order to pass, upon insertion of said supporting means in a wringing basket associated with a water containment bucket, from an active or extended condition, in which the respective main longitudinal directions define a working surface, to a wringing or retracted condition, in which the respective longitudinal directions of said at least two arms are angularly spaced from said working surface, return means being further provided which are adapted to return said supporting means to the active or extended condition as a consequence of disengagement from said wringing basket, said at least two arms comprising each a respective active face, which during use is arranged so as to face at least partially a portion of said cleaning means, the respective active faces of said at least two arms being arranged on said working surface in said active condition, said cleaning means comprising a cloth, and said cloth comprising at least one continuous longitudinal portion, which is arranged outside a respective longitudinal edge of said two arms, and a substantially transverse cut, which is arranged at said articulation axis.

15. (cancelled).

16. (currently amended) The floor cleaning device according to claim ~~15~~ 14, wherein said wringing basket comprises at least two walls having a plurality of draining openings, that converge toward the bottom of said containment bucket, and form

engagement walls for a respective portion of said cleaning means that is associated with a respective active face.

17. (previously presented) The floor cleaning device according to claim 14, wherein said supporting means comprises two opposite arms, at least one of said two arms being fitted so that it can rotate, with respect to a fixed part, about an articulation axis that is substantially perpendicular to said respective main longitudinal directions of said two arms.

18. (previously presented) The floor cleaning device according to claim 16, wherein said containment bucket is associated with a collection receptacle, which during use is arranged below said wringing basket and is adapted to collect the liquid that passes through said plurality of draining openings.

19. (previously presented) The floor cleaning device according to claim 14, wherein said return means comprises at least one spring, which acts between said fixed part and at least one of said at least two arms or between said two arms, in order to keep said supporting means in said active or extended condition.

20. (cancelled).

21. (cancelled).

22. (currently amended) The floor cleaning device according to claim ~~21~~ 14, wherein said cloth comprises two continuous longitudinal portions, which are arranged outside the longitudinal edges of said two arms, and a substantially U-shaped cut, which has two parallel portions arranged at said longitudinal edges and a portion for connecting said two parallel portions, which is arranged at said articulation axis.

23. (currently amended) The floor cleaning device according to claim ~~20~~ 14, wherein said cloth is a cloth made of microfiber.

24. (currently amended) The floor cleaning device according to claim ~~20~~ 14, wherein said active faces comprise means for retaining said cloth.

25. (previously presented) The floor cleaning device according to claim 24, wherein said retention means comprises a plurality of pins that protrude from said active faces and have an enlarged head.

26. (previously presented) The floor cleaning device according to claim 17, wherein said kinematic connection means comprises at least one articulation element for connection between a cup-shaped element that can be coupled to the end of the stick and said fixed part.
